IMPORTANT - Please READ:

It is recommended that if you are unfamiliar with this type of work that you refer to a qualified service center specializing in this type of work. It is also recommended that if you choose to do this work yourself that a factory service manual be obtained for the proper procedures pertaining to component removal, replacement and proper torque specifications for your vehicle. This instruction set is intended as a guideline for the safe installation of Energy Suspension's polyurethane bushings, once you have removed the factory components from your vehicle. Wheel alignment is almost always disturbed when suspension components are removed or replaced. It is recommended that you have the alignment checked on your vehicle at a qualified alignment shop. Prior to installation, make sure that your vehicle is in top mechanical condition and that there are no suspension or steering related problems. These components have been designed to work only with a vehicle that is in good state of repair. No matter how carefully we design our parts, this is one area we have no control over and cannot be held responsible. The installation of these components may void the factory warranty for your vehicle. Please contact your local dealership for details concerning the factory warranty before installation. Energy Suspension recommends that you thoroughly read over all the installation instructions and check all P/N's and quantities in the Parts List before you start. Call customer service at 949-361-3935 if the parts in your kit do not match this Parts List.

Instructions

1. Before loosening or removing any fasteners, mark the 4 inner toe adjustment washers with a paint stick or marker. These marks are used during re-assembly to ensure the same alignment is retained when the install is finished.

2. While removing only one arm at a time, only the bonded rubber bushings must be removed for the install of new polyurethane bushings*. **DO NOT REMOVE OR DAMAGE THE OUTER METAL SHELLS PRESSED INTO THE O.E. ARM.** Use a propane torch or similar to evenly heat the pressed-in shells and break the bonds to the rubber bushings. The bonds will be broken when a slight amount of smoke and bubbling material starts to escape from between the shell and rubber bushing. Clean the pressed-in shell I.D. of any remaining rubber with a wire brush and de-burr any sharp edges of the shell.
